Yeah, if we could get the same color scheme on both, I think management would like that. I hope it's not too big a hassle!

One question: I haven't looked at the data really closely, so I'm wondering...the Walworth one is very squarish...is that because the >1xNAAQS concentrations actually extend off the receptor grid? I know that's a question I'll be asked based on the shape of the plume, so I want to be ready for it.

I went with a completely different color scheme because the yellow was too washed out and looked too similar to the background topo...so I can remake Redwing if you want 1X and 2X to be the same on both maps.

(This blue of Walworth might not look too good next to the blue of the Mississippi River on Redwing...so I'd come up with something entirely different if you want them to be both the same – and not a problem, just let me know)
